

## Teachers' Notes I

### Activity I2

#### Growing Food in Your School Grounds.

One of the many benefits of growing food in your school grounds is that it allows your pupils to be responsible for choosing an area to plant, preparing the area, choosing the seeds, looking after them during growth, and finally being able to reap the rewards through taste testing at the end of the project.

The following activities highlight the main topics that pupils will need to think about in order to begin to grow things in their school grounds.

Pupils might need some extra help in deciding which plants are suitable for growing within your specific school area, and also will need help to make sure it is acceptable to the school management to take over the running of a small area of the grounds.

This project can be very successful in even one square metre of ground, so don't be put off if you don't have a lot of space.
